MOHOS TŐZELGLÁP ÉS A SZENT ANNA-TÓ ÖKOTURISZTIKAI FEJLESZTÉSI KONCEPCIÓJA

ECOTOURISM DEVELOPMENT CONCEPT OF THE MOHOS PEAT BOG AND THE SAINT ANA LAKE

The decision for the land use of the area has always been based on both personal and professional experience. For the planning area I have chosen the Saint Ana lake area, as it represents the largest area of the Mohos peat bog. The lake also serves as a source for the main water supply of the region.

In the research part of the assignment, I have used the planning area of the lake as an example to illustrate the potential of ecotourism development. The conceptualization of the planning area and the analysis of the situation take place above the area of the lake.

The project area is characterized by its geographical and landscape features. The planning area is located in the area of the Mohos peat bog, which is one of the largest areas of this kind in the country. The lake is surrounded by a diverse range of natural habitats, including wetlands, forests, and meadows.

The main goal of the project is to develop an ecotourism concept that is in harmony with the natural environment and the local community. The design is based on a combination of natural and artificial elements.

The concept includes the following features:

- The development of a nature trail around the lake
- The creation of a viewing platform overlooking the lake
- The establishment of a nature education center
- The development of a water-based tourism concept
- The creation of a network of cycle paths

The concept is designed to be sustainable and environmentally friendly. The materials used for the construction are locally sourced and the energy sources are renewable.

The project is intended to be a model for sustainable tourism development and to promote the appreciation of nature and the importance of protecting the environment.
